Algorithm 1 Physics-Informed Neural Network (PINN) Training for Epidemic Modeling

Require: Training data tensors S_{data} , I_{data} , R_{data} , Time tensor t_{data} , Population N , Neural Network NN with weights w and biases b

Ensure: Preprocessed tensors on the same device

- 1: Initialize NN with Xavier initialization for weights w and biases b
- 2: Define early stopping criteria with patience and delta
- 3: Set learning rate lr and regularization parameters λ , p
- 4: **for** each epoch up to num_epochs **do**
- 5: Compute predictions: $S_{pred}, I_{pred}, R_{pred} \leftarrow NN(t_{data})$
- 6: Compute time derivatives of $S_{pred}, I_{pred}, R_{pred}$ via autograd
- 7: Calculate residuals using SIR model equations:

$$\begin{aligned}\frac{dS}{dt} &= -\beta \frac{S_{pred} I_{pred}}{N} \\ \frac{dI}{dt} &= \beta \frac{S_{pred} I_{pred}}{N} - \gamma I_{pred} \\ \frac{dR}{dt} &= \gamma I_{pred}\end{aligned}$$

- 8: Compute loss function components:
 - 9: $MSE_{SIR} \leftarrow \frac{1}{q} \sum_{i=1}^q [(S_i - S_{pred_i})^2 + (I_i - I_{pred_i})^2 + (R_i - R_{pred_i})^2]$
 - 10: $MSE_{residuals} \leftarrow \frac{1}{q} \sum_{i=1}^q \left[\left(\frac{dS_i}{dt} - \frac{dS_{pred_i}}{dt} \right)^2 + \left(\frac{dI_i}{dt} - \frac{dI_{pred_i}}{dt} \right)^2 + \left(\frac{dR_i}{dt} - \frac{dR_{pred_i}}{dt} \right)^2 \right]$
 - 11: $Loss \leftarrow MSE_{SIR} + MSE_{residuals} + \lambda \cdot \text{Regularization}(NN)$
 - 12: Update NN parameters via backpropagation and optimization step
 - 13: Adjust learning rate with learning rate scheduler if needed
 - 14: Check for early stopping, break if condition is met
 - 15: **end for**
 - 16: **Output:** Trained PINN model NN
-

The SIR model is described by the following set of differential equations:

$$\frac{dS}{dt} = -\beta \frac{SI}{N}, \tag{1}$$

$$\frac{dI}{dt} = \beta \frac{SI}{N} - \gamma I, \tag{2}$$

$$\frac{dR}{dt} = \gamma I, \tag{3}$$

where S is the number of susceptible individuals, I is the number of infectious individuals, R

is the number of recovered individuals, and N is the total population.

Parameter	Definition
β	Transmission rate
γ	Recovery rate

Algorithm 2 Training of Physics-Informed Neural Network (PINN) for Epidemic Modeling

Require: Training data tensors $S_{data}, I_{data}, R_{data}$, time tensor t_{data} , population size N , initial learning rate lr , regularization parameters λ_{reg}, p_{reg} , and number of epochs num_epochs .

Ensure: All tensors are on the computational device, e.g., GPU.

- 1: Initialize PINN NN with weights w and biases b using Xavier initialization.
- 2: Define EarlyStopping class with patience, delta, and verbose output.
- 3: Set up the Adam optimizer with learning rate lr and weight decay.
- 4: Set up learning rate scheduler with reduction factor and patience.
- 5: **for** $epoch = 1$ to num_epochs **do**
- 6: Compute predictions $S_{pred}, I_{pred}, R_{pred}$ from $NN(t_{data})$.
- 7: Compute gradients $\frac{dS_{pred}}{dt}, \frac{dI_{pred}}{dt}, \frac{dR_{pred}}{dt}$ with respect to t_{data} using automatic differentiation.
- 8: Define the SIR model's theoretical dynamics:

$$\begin{aligned}\frac{dS}{dt} &= -\beta \frac{SI}{N}, \\ \frac{dI}{dt} &= \beta \frac{SI}{N} - \gamma I, \\ \frac{dR}{dt} &= \gamma I.\end{aligned}$$

- 9: Compute the loss components:

$$\begin{aligned}MSE_{SIR} &= \frac{1}{q} \sum_{i=1}^q [(S_i - S_{pred_i})^2 + (I_i - I_{pred_i})^2 + (R_i - R_{pred_i})^2], \\ MSE_{residuals} &= \frac{1}{q} \sum_{i=1}^q \left[\left(\frac{dS_{pred_i}}{dt} + \beta \frac{S_{pred_i} I_{pred_i}}{N} \right)^2 + \left(\frac{dI_{pred_i}}{dt} - \beta \frac{S_{pred_i} I_{pred_i}}{N} + \gamma I_{pred_i} \right)^2 + \left(\frac{dR_{pred_i}}{dt} - \gamma I_{pred_i} \right)^2 \right]\end{aligned}$$

- 10: Compute regularization term (if L2 regularization is used):

$$Reg_{L2} = \lambda_{reg} \sum_w \|w\|^{p_{reg}}.$$

- 11: Compute total loss:

$$Loss = MSE_{SIR} + MSE_{residuals} + Reg_{L2}.$$

- 12: Perform backpropagation and update PINN parameters using the optimizer.
- 13: Update learning rate with scheduler based on the validation loss.
- 14: **if** EarlyStopping condition is met **then**
- 15: **break**
- 16: **end if**
- 17: **if** $(epoch + 1) \bmod 100 = 0$ or $epoch = 0$ **then**
- 18: Log current epoch and loss for monitoring.
- 19: **end if**
- 20: **end for**
- 21: **Output:** Trained PINN NN .

Algorithm 3 Physics-Informed Neural Network (PINN) for SIR Dynamics

Require: Training dataset $\mathcal{D} = \{(t_i, S_i, I_i, R_i)\}_{i=1}^N$, where t_i denotes time, and S_i, I_i, R_i represent susceptible, infected, and recovered individuals at time t_i , respectively.

1: **Data Preprocessing:**

2: Convert \mathcal{D} into tensors: $\mathbf{S}, \mathbf{I}, \mathbf{R} \in \mathbb{R}^{N \times 1}$ and $\mathbf{t} \in \mathbb{R}^{N \times 1}$.

3: **Neural Network Architecture:**

4: Define a fully connected neural network $\mathcal{N}(\mathbf{t}; \theta)$ with input \mathbf{t} , parameters θ , hidden layers, and Tanh activation functions. The network predicts $\hat{\mathbf{S}}, \hat{\mathbf{I}}, \hat{\mathbf{R}}$ at times \mathbf{t} .

5: **Loss Function:**

6: The loss function $\mathcal{L}(\theta)$ consists of two parts: the prediction loss and the differential equation loss.

7: Prediction loss: $\mathcal{L}_{\text{pred}} = \frac{1}{N} \sum_{i=1}^N \left(\|\hat{\mathbf{S}}_i - \mathbf{S}_i\|^2 + \|\hat{\mathbf{I}}_i - \mathbf{I}_i\|^2 + \|\hat{\mathbf{R}}_i - \mathbf{R}_i\|^2 \right)$.

8: DE loss: Compute the gradients $\frac{d\hat{\mathbf{S}}}{dt}, \frac{d\hat{\mathbf{I}}}{dt}, \frac{d\hat{\mathbf{R}}}{dt}$ using automatic differentiation. Use these to define the SIR model's dynamics:

$$\begin{aligned} \frac{dS}{dt} &= -\beta \frac{SI}{N}, \\ \frac{dI}{dt} &= \beta \frac{SI}{N} - \gamma I, \\ \frac{dR}{dt} &= \gamma I. \end{aligned}$$

9: $\mathcal{L}_{\text{DE}} = \frac{1}{N} \sum_{i=1}^N \left(\left\| \frac{d\hat{\mathbf{S}}_i}{dt} + \beta \frac{\hat{\mathbf{S}}_i \hat{\mathbf{I}}_i}{N} \right\|^2 + \left\| \frac{d\hat{\mathbf{I}}_i}{dt} - \beta \frac{\hat{\mathbf{S}}_i \hat{\mathbf{I}}_i}{N} + \gamma \hat{\mathbf{I}}_i \right\|^2 + \left\| \frac{d\hat{\mathbf{R}}_i}{dt} - \gamma \hat{\mathbf{I}}_i \right\|^2 \right)$.

10: Total loss: $\mathcal{L} = \mathcal{L}_{\text{pred}} + \mathcal{L}_{\text{DE}}$.

11: **Training:**

12: Use gradient descent to minimize $\mathcal{L}(\theta)$ with respect to θ .

13: Apply early stopping based on validation loss to prevent overfitting.

14: **Evaluation:**

15: Evaluate the trained model $\mathcal{N}(\mathbf{t}; \theta^*)$ on test data to predict $\hat{\mathbf{S}}, \hat{\mathbf{I}}, \hat{\mathbf{R}}$.

16: Compare predictions with actual data to assess model performance.

Algorithm 4 PINNs used to determine simultaneously the parameters of the neural network and the embedded SIR model.

Require: Time points t , initial susceptible S^0 , infected I^0 , and recovered R^0 populations.

- 1: Randomly initialize weights w , biases b , and dynamics parameters β, γ ;
- 2: **for** each epoch in epochs **do**
- 3: The values of each compartment of the SIR model can be obtained from the forward propagation of the neural network with the input as t :
- 4: $S, I, R = NN(t)$;
- 5: Evaluate the composed loss function, including the data loss (with s to be the number of observations in each compartment, thus the number of time points collected):
- 6: $MSE_{SIR} = \frac{1}{s} \sum_{i=1}^s ((S_i - S_i^0)^2 + (I_i - I_i^0)^2 + (R_i - R_i^0)^2)$, denoting the mismatch of the output of the neural network and observation data.
- 7: Here the residual loss:
- 8: $MSE_{residuals} = \frac{1}{q} \sum_{i=1}^q \left(\left\| \frac{dS_i}{dt_i} + \frac{\beta S_i I_i}{N} \right\|^2 + \left\| \frac{dI_i}{dt_i} - \frac{\beta S_i I_i}{N} + \gamma I_i \right\|^2 + \left\| \frac{dR_i}{dt_i} - \gamma I_i \right\|^2 \right)$,
- 9: stands for the sum of the residual errors for each compartment of the SIR model.
- 10: Thus, the total loss function can be obtained:
- 11: $Loss = MSE_{SIR} + MSE_{residuals}$;
- 12: The Adam Optimizer toolkit in Pytorch is utilized to update the weights w and biases b , as well as β and γ by minimizing the loss function.
- 13: **end for**

Algorithm 5 Training PINN for SIR Model

Require: Time points t , initial susceptible S_0 , infected I_0 , recovered R_0 , population N .

- 1: Randomly initialize neural network parameters θ .
- 2: **for** each epoch **do**
- 3: Obtain S, I, R from neural network: $S, I, R = \mathcal{N}(t; \theta)$.
- 4: Calculate data loss MSE_{SIR} :
- 5: $MSE_{SIR} = \frac{1}{N} \sum_{i=1}^N ((S_i - S_{0i})^2 + (I_i - I_{0i})^2 + (R_i - R_{0i})^2)$.
- 6: Compute residuals $\frac{dS}{dt}, \frac{dI}{dt}, \frac{dR}{dt}$ via autodiff.
- 7: Calculate SIR model loss $MSE_{residuals}$:
- 8: $MSE_{residuals} = \frac{1}{N} \sum_{i=1}^N \left(\left| \frac{dS_i}{dt} + \beta \frac{S_i I_i}{N} \right|^2 + \left| \frac{dI_i}{dt} - \beta \frac{S_i I_i}{N} + \gamma I_i \right|^2 + \left| \frac{dR_i}{dt} - \gamma I_i \right|^2 \right)$.
- 9: Total loss $Loss = MSE_{SIR} + MSE_{residuals}$.
- 10: Update θ using optimizer to minimize $Loss$.
- 11: Implement early stopping if validation loss does not improve.
- 12: **end for**

Algorithm 6 Streamlined PINN Algorithm for SIR Model

Require: Time points t , initial conditions S_0, I_0, R_0 , total population N .

- 1: Randomly initialize network parameters θ and disease parameters β, γ .
 - 2: **for** each epoch **do**
 - 3: Propagate t through network to get $S, I, R = \mathcal{N}(t; \theta)$.
 - 4: Compute data fidelity loss MSE_{SIR} :
 - 5: $MSE_{SIR} = \frac{1}{N} \sum_{i=1}^N ((S_i - S_{0i})^2 + (I_i - I_{0i})^2 + (R_i - R_{0i})^2)$.
 - 6: Derive SIR dynamics residuals via autodiff:
 - 7: $MSE_{residuals} = \frac{1}{N} \sum_{i=1}^N \left(\left| \frac{dS_i}{dt} + \beta \frac{S_i I_i}{N} \right|^2 + \left| \frac{dI_i}{dt} - \beta \frac{S_i I_i}{N} + \gamma I_i \right|^2 + \left| \frac{dR_i}{dt} - \gamma I_i \right|^2 \right)$.
 - 8: Define total loss $Loss = MSE_{SIR} + MSE_{residuals}$.
 - 9: Minimize $Loss$ to update θ, β , and γ with optimizer.
 - 10: Apply early stopping based on validation loss.
 - 11: **end for**
-

Algorithm 7 Parameter Estimation for SEIRD Model via Differential Equation Learning

Require: Time series data, population data, initial infected and death counts.

- 1: Normalize and partition data for model inputs.
 - 2: Initialize model states $u(t_0) = [S_0, E_0, I_0, R_0, D_0]$.
 - 3: Discretize time domain into t_1, t_2, \dots, t_n .
 - 4: Construct neural networks $NN_\beta(t; \theta_\beta), NN_\gamma(t; \theta_\gamma), NN_\delta(t; \theta_\delta), NN_\alpha(t; \theta_\alpha)$ with parameters $\theta_\beta, \theta_\gamma, \theta_\delta, \theta_\alpha$.
 - 5: Define the SEIRD differential equations with learned parameters:
 - 6: **function** SEIRD(\dot{u}, u, θ, t)
 - 7: $\beta(t), \gamma(t), \delta(t), \alpha(t) \leftarrow |NN_\beta(t; \theta_\beta)|, |NN_\gamma(t; \theta_\gamma)|, |NN_\delta(t; \theta_\delta)|, |NN_\alpha(t; \theta_\alpha)|$
 - 8: $\dot{S}, \dot{E}, \dot{I}, \dot{R}, \dot{D} \leftarrow$ transitions based on SEIRD dynamics and $\beta(t), \gamma(t), \delta(t), \alpha(t)$
 - 9: **end function**
 - 10: Formulate the initial value problem (IVP) using $u(t_0)$ and SEIRD dynamics.
 - 11: Define loss function $\mathcal{L}(\theta)$ combining prediction errors and parameter trajectory regularizations.
 - 12: Minimize $\mathcal{L}(\theta)$ using gradient-based optimization with callbacks to monitor convergence.
 - 13: Evaluate model fit with metrics such as MSE, MAE, MAPE, RMSE.
-

The SEIRD model extends the SIR model by including compartments for exposed (E) and dead (D) individuals:

$$\frac{dS}{dt} = -\beta \frac{SI}{N}, \quad (4)$$

$$\frac{dE}{dt} = \beta \frac{SI}{N} - \delta E, \quad (5)$$

$$\frac{dI}{dt} = \delta E - (\gamma + \alpha)I, \quad (6)$$

$$\frac{dR}{dt} = \gamma I, \quad (7)$$

$$\frac{dD}{dt} = \alpha I, \quad (8)$$

where E represents the exposed individuals who are infected but not yet infectious, and D represents the deceased individuals.

Parameter	Definition
β	Transmission rate
δ	Rate at which exposed individuals become infectious
γ	Recovery rate
α	Mortality rate
